

CUSTOMER RELATIONSHIP / FMS + COMPREHENSIVE AMC

IT service continuity. Clear ownership at every step.

Facility management, software-service support and maintenance of PCs, printers and scanners at NTPC Jhanor.

2 YEARS

RELATIONSHIP STATED BY D-TECH

SLA + FLOW

Documented award: PO 4600074816 | 25 May 2023 | Service period: 01 June - 30 November 2023

Supplied NTPC images are brand context; their location is not verified as Jhanor. Two-year continuity is stated by D-TECH.

01 / ENGAGEMENT AND CONTRACT BASIS

Two years of association. A defined service scope.

The relationship duration is provided by D-TECH; the supplied signed PO documents one six-month award.

Contract element	Documented position
Customer and site	NTPC Limited - Jhanor Gandhar Gas Power Project, P.O. Urjanagar, Jhanor, District Bharuch, Gujarat.
Award reference	Service PO 4600074816-006-1021 dated 25 May 2023; CS-1021044 Maintenance Contract of IT Services at NTPC Jhanor.
Documented period	01 June 2023 to 30 November 2023. Actual commencement as directed by the Engineer-in-Charge (EIC).
Service categories	Comprehensive AMC of PCs, laser / colour / network / multifunction printers and flatbed scanners; facility management and software-service support.
Contract controls	Monthly progressive billing with relevant records; safety-linked provision. Detailed scope and conditions are referenced to Section V and GCC.
Relationship and SLA basis	Two-year association stated by D-TECH. Renewal orders and the detailed Section V / SLA annexure were not supplied; numerical SLA targets are not asserted.

Service interaction design | **SLA and escalation controls** | **Complaint-to-closure workflow**

02 / SERVICE DELIVERY ARCHITECTURE

An accountable support model for daily IT operations

Functional service design for the case study; not a network as-built or an expansion of the signed scope.

Staffing numbers, shift patterns, network assets and server coverage follow the executed scope; none are inferred from the BOQ alone.

03 / MICRO-LEVEL TECHNICAL SUPPORT

Diagnose the service path, then verify the recovery

Recommended working checks for agreed assets, subject to customer permissions and the applicable maintenance scope.

Service layer	Technical checks and closure evidence
PC hardware and OS	Identify asset and symptom; check power, boot state, storage health indicators, device errors, OS events and resource use. Record findings and approved corrective action.
Software and user support	Reproduce the issue; check approved application version, profile, permissions and configuration. Protect user data before repair or reinstallation; validate the user workflow.
Printers and queues	Separate device, queue, driver and connectivity faults. Check error state, paper path, test page and authorized consumable / part ownership. Verify printing from the affected user.
Scanners and peripherals	Check power, interface, detection, driver and scan settings. Test a representative scan, file output and application integration where within scope.
Connectivity dependencies	Check patch lead, port link, approved IP settings and reachability. Route switching, identity or upstream faults to the authorized owner; do not make uncontrolled changes.
Preventive and repair records	Use an approved checklist; record condition, repeat faults, repair / replacement approval and post-service tests. Service frequencies and spare obligations follow the contract.

Backup, server administration, cybersecurity and OT changes require explicit scope and authorization.

04 / SLA AND ESCALATION FRAMEWORK

A measurable service clock with clear accountability

Operational framework for agreement; numerical response, attendance and restoration targets require the signed SLA schedule.

Priority	Illustrative impact	Handling and escalation
P1 / Critical	Multiple users or an essential IT workflow unavailable.	Record impact and affected assets; engage the agreed urgent route, notify NTPC IT / EIC and assign a technical owner.
P2 / High	A user or department is blocked; limited workaround.	Prioritize diagnosis, arrange approved onsite / specialist support and track repair or dependency ownership.
P3 / Routine	A request, intermittent issue or planned preventive task.	Schedule within the agreed service window; confirm user availability, access and acceptance checks.

SLA measure	Required record and measurement control
Response	Ticket receipt to recorded acknowledgement / technical engagement; use the contracted target.
Attendance and restoration	Record dispatch, arrival, workaround and restoration separately. Track customer / OEM dependencies visibly.
Escalation and closure	Named owner, next update, action history, customer verification and reopen route. Pause rules require agreement.

No 24x7 coverage, guaranteed uptime, fixed restoration time or unlimited replacement commitment is inferred from the supplied PO.

05 / COMPLAINT-TO-CLOSURE FLOW

Every request has an owner, action and acceptance

Recommended execution flow; timing, staffing and reporting frequency follow the executed service agreement.

01 LOG AND IDENTIFY

Capture requester, asset ID, location, symptom, timestamp and business impact; issue a ticket reference.

02 TRIAGE AND ASSIGN

Check scope, priority and service dependency. Assign the FMS owner and start the agreed SLA clock.

03 DIAGNOSE

Reproduce the fault; inspect device, OS, software, print / scan or connectivity path. Record evidence.

04 RESTORE / ESCALATE

Apply an approved remedy. Escalate blocked cases to D-TECH, NTPC IT or OEM with findings and next action.

05 VERIFY WITH USER

Test the original affected workflow. Confirm service recovery and note outstanding risk or follow-up.

06 CLOSE AND IMPROVE

Record cause, action, parts and acceptance. Reopen if needed; review recurring issues for prevention.

06 / GOVERNANCE AND CUSTOMER VALUE

Consistent service, supported by reviewable records

A two-year customer association, as stated by D-TECH, supported here by the supplied NTPC IT-services award.

SERVICE VISIBILITY

A consolidated incident register connects reported issues, technical findings, ownership and user acceptance.

CONTROLLED EXECUTION

Approved access and changes, documented repair decisions and customer coordination support accountable delivery.

CONTINUOUS FOLLOW-UP

Review repeat faults, open dependencies and preventive actions against the agreed reporting cadence.

Source and scope notes

Source: signed NTPC Service PO 4600074816 dated 25 May 2023, six pages. Section V scope / conditions and GCC are referenced but were not included. BOQ quantities are not presented as unique installed-asset counts.

The two-year relationship is D-TECH-provided information, separate from the PO term. Diagrams and technical checks describe a delivery approach; they do not establish measured performance, renewal dates or additional contract obligations.
