The engagement | Server AMC and a clear service route

A server-maintenance engagement needs more than a contact number. The client needs an identifiable covered asset, a consistent way to raise a complaint and clear responsibility from diagnosis through restoration. D-TECH’s support framework connects those steps to a ticket reference and customer confirmation.

Order detail	Scope recorded in the purchase order
Customer	Netafim Irrigation India Pvt. Ltd.
Covered equipment	1 × Dell EMC PowerEdge R740xd server Service tag: 9S6DCD3
Service	Comprehensive AMC Duration: 1 year
Reference	PO 2900649059 dated 07 August 2026 Supplier quotation S21675
Site / delivery address	Plot Nos. 268-270, 271B, GIDC-Manjusar, Savli, Vadodara - 391775, Gujarat

The support design

An accountable complaint process; impact-based priority; remote and onsite coordination; covered-hardware repair / replacement coordination; restoration validation and documented closure. The detailed coverage schedule and AMC activation dates govern delivery.

[Contents](#) | [Support process 03](#) • [SLA framework 04](#) • [Resolution routes 05](#) • [Customer care & login 06](#)

Complaint to closure | One traceable support process

Raise the request through the support portal or call customer care. D-TECH records a ticket / reference, assigns priority from business impact and coordinates the technical response. The same reference follows the request through updates, escalation and closure.

Unresolved or at risk of SLA breach? Escalate to the support lead; retain the ticket and share the next action with the client.

SLA framework | Priority, response and restoration

The supplied PO confirms comprehensive AMC and a one-year term; it does not set response times, restoration times or a 24x7 service window. The following matrix is a proposed support framework to confirm in the AMC activation sheet.

Priority / impact	Initial response	Restoration goal*	Update cadence
P1 · Critical Server / key business service unavailable	30 minutes	Workaround / restoration target: 4 hours	Every hour until stabilised
P2 · High Major degradation; business work restricted	2 service hours	1 business day	Every 4 service hours
P3 · Medium Partial fault; workable alternative available	4 service hours	2 business days	Daily progress update
P4 · Planned Advice / scheduled maintenance request	1 business day	Agreed change / service schedule	At agreed milestones

How the SLA is measured

Response = engineer / service-desk engagement, not an automatic acknowledgement. Restoration = the affected service is available again; permanent repair may continue under the same ticket. Time is measured within the agreed support window.

* Proposed goals depend on diagnosis, safe access and covered-part availability. Confirm the service window, onsite dispatch, escalation timings and part logistics before treating these values as contractual commitments.

Resolution support | Diagnose, restore and confirm

The assigned engineer selects the right route after diagnosis. Production changes follow client approval and a rollback plan. If a hardware fault is confirmed, repair or replacement of covered components is coordinated under the comprehensive AMC terms.

If validation fails, keep the ticket open and return to diagnosis. Closure records include the cause found, work performed and any pending follow-up.

Customer care | Login, raise and track your request

D-TECH CUSTOMER CARE

Use your existing customer login to open the support portal. Share the server service tag and business impact when reporting a complaint. Keep the ticket / reference number for every follow-up.
