CASE STUDY / LEWENS LABS / DAHEJ

One infrastructure. Connected operations.

Design, deployment and lifecycle ownership

Networking, servers, Wi-Fi, telephony, attendance, endpoints, backup, internet, antivirus and Microsoft 365 brought into one managed IT scope.

1 FMS ENGINEER
ONSITE SUPPORT SCOPE

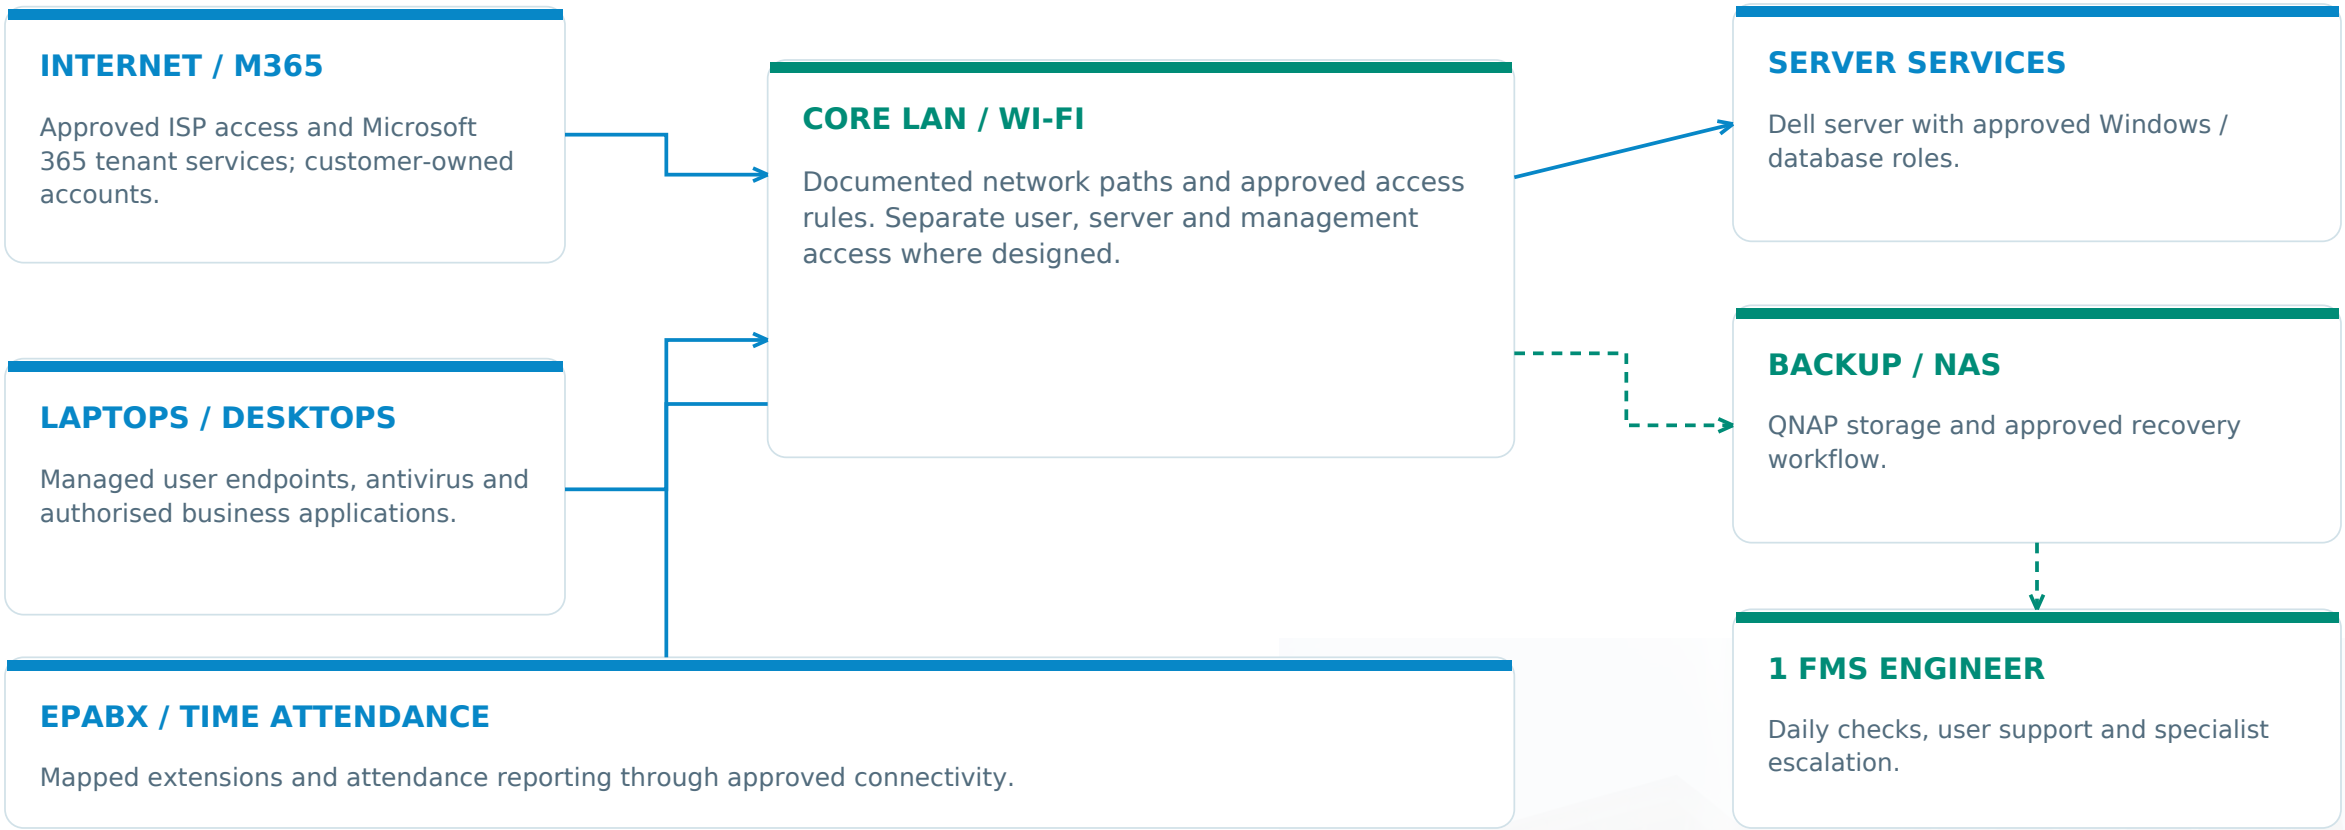

Engagement | Bringing the complete IT scope together

Lewens Labs requires a coordinated IT environment in which users, business applications, communications and data protection operate with clear ownership. D-TECH's scope, as described for this case study, combines infrastructure delivery with one FMS engineer to support day-to-day operations.

Scope layer	Requirement and solution approach
CONNECTIVITY	Structured networking, approved internet access and Wi-Fi coverage; documented addressing, port maps and access policies.
SERVER / DATA	Enterprise server services, storage, Microsoft server software and backup; controlled configuration and recovery checks.
WORKPLACE	Laptops, desktops, antivirus and Microsoft 365 accounts; consistent builds, authorised access and asset-to-user records.
COMMUNICATIONS / HR	EPABX extensions and time-attendance systems; approved call flows, enrolment and attendance report checks.
OPERATIONS	One FMS engineer supported by D-TECH specialists; incident records, preventive checks, escalations and handover documentation.

Reading guide: 03 Architecture | 04 Server and backup | 05 Implementation and acceptance | 06 Customer and support

Architecture | Connecting users, services and support

Customer scope diagram: network quantities, VLAN IDs, IP values, application roles and product versions must follow approved site records.

Server and recovery | The documented technical foundation

Source record	Documented equipment / software	Implementation consideration
2019 | LL0940	1 Dell T30 server; 1 Microsoft Server WIN line (P73-07113).	Earlier procurement reference; current role and live status require inventory confirmation.
2021 | 4100000023	1 Dell PowerEdge T440; Windows Server Standard 2019 16-core line; SQL Server Standard 2019 line.	Approve server roles, OS build and database licensing. PO vendor-note part references are inconsistent; verify entitlements.
2021 | ENDPOINT	1 Dell OptiPlex 5080 MT; Core i5-10500, 16GB RAM, 512GB SSD, Windows 10 Pro, 21.5-inch display.	Historical ordered specification, not a current OS support recommendation or proof of the live fleet.
2021 | STORAGE	1 QNAP TS-832PX 8-bay NAS; 2 Seagate NAS disks of 2TB each.	4TB raw disk capacity. Installed RAID, usable capacity, backup software and retention are not established by the PO.

BUILD BASELINE

Record Service Tags, firmware, storage layout, approved OS / application settings and restricted management access.

RECOVERY BASELINE

Define backup jobs, retention and recovery objectives; test a representative restore. RAID and local NAS alone do not establish disaster recovery.

Technical specifications are historic PO references. No current warranty, installed RAID, replication, uptime or completed recovery result is inferred.

Deployment | From site survey to accepted service

Stage	Execution scope	Acceptance record
01 | SURVEY	Verify rooms, racks, power, cabling, endpoints, user groups, ISP routes, Wi-Fi needs and existing configurations.	Site checklist, asset register and agreed design.
02 | NETWORK	Label and test links; configure approved switch, internet and wireless access settings; preserve rollback copies.	Port / cable maps, connectivity and coverage tests.
03 | SERVER / BACKUP	Baseline hardware and OS; configure approved roles and database access; establish backup jobs and restore checks.	Build record, service access and restore evidence.
04 | WORKPLACE	Build laptops / desktops; enrol approved security and M365 accounts; transfer only authorised user data.	Asset-user mapping, application and access tests.
05 | EPABX / ATTENDANCE	Configure agreed extensions, calling rules and attendance users; verify sample punches, reports and time settings.	Call tests, enrolment list and report reconciliation.
06 | HANDOVER	Close exceptions; transfer configurations and credentials securely; brief the FMS engineer and customer owner.	Signed tests, support route and handover pack.

Installation settings, dates and results are to be populated from project records. Quantities beyond the referenced order lines were not supplied.

Lifecycle value | Infrastructure with accountable support

The integrated approach gives the customer one route for coordinating infrastructure changes, user issues and technical escalation. Asset records, configuration ownership and repeatable acceptance checks make the environment easier to support. These are intended benefits; measured results were not supplied.

CUSTOMER & SITE

Lewens Labs Pvt. Ltd.
Plot D2/CH/376-377, GIDC II, Dahej, Bharuch, Gujarat.
Reference orders: LL0940, 02 January 2019; 4100000023, 23 June 2021.

ONE FMS ENGINEER + D-TECH

Onsite user support and routine checks, with specialist escalation for networking, servers, backup, telephony and software. Shift hours, relief coverage and service targets follow the signed scope.
